1.

3-way-Merge Sort : Suppose that instead of dividing in half at each step of Merge Sort, you divide into thirds, sort each third, and finally combine all of them using a three-way merge subroutine. What is the overall asymptotic running time of this algorithm? (Hint: Note that the merge step can still be implemented in $O(n)$ time.)

$n \log(n)$

$n^2 \log(n)$

n

$n(\log(n))^2$
- 1/1 分

正确

That's correct! There is still a logarithmic number of levels, and the overall amount of work at each level is still linear.

2.

You are given functions f and g such that $f(n) = O(g(n))$. Is $f(n) * \log_2(f(n)^c) = O(g(n) * \log_2(g(n)))$? (Here c is some positive constant.) You should assume that f and g are nondecreasing and always bigger than 1.

True

False

Sometimes yes, sometimes no, depending on the constant c

Sometimes yes, sometimes no, depending on the functions f and g
- 1/1 分

正确

That's correct! Roughly, because the constant c in the exponent is inside a logarithm, it becomes part of the leading constant and gets suppressed by the big-Oh notation.

3.

Assume again two (positive) nondecreasing functions f and g such that $f(n) = O(g(n))$. Is $2^{f(n)} = O(2^{g(n)})$? (Multiple answers may be correct, you should check all of those that apply.)

Always

Never

Sometimes yes, sometimes no (depending on f and g)
- 1/1 分

正确

Yes if $f(n) \leq g(n)$ for all sufficiently large n

正确

4.

k-way-Merge Sort. Suppose you are given k sorted arrays, each with n elements, and you want to combine them into a single array of kn elements. Consider the following approach. Using the merge subroutine taught in lecture, you merge the first 2 arrays, then merge the 3^{rd} given array with this merged version of the first two arrays, then merge the 4^{th} given array with the merged version of the first three arrays, and so on until you merge in the final (k^{th}) input array. What is the running time taken by this successive merging algorithm, as a function of k and n ? (Optional: can you think of a faster way to do the k-way merge procedure ?)

$\theta(nk^2)$

$\theta(n^2k)$

$\theta(nk)$

$\theta(n \log(k))$
- 1/1 分

正确

That's correct! For the upper bound, the merged list size is always $O(kn)$, merging is linear in the size of the larger array, and there are k iterations. For the lower bound, each of the last $k/2$ merges takes $\Omega(kn)$ time.

5.

Arrange the following functions in increasing order of growth rate (with $g(n)$ following $f(n)$ in your list if and only if $f(n) = O(g(n))$).

a) $n^2 \log(n)$

b) 2^n

c) 2^{2^n}

d) $n^{\log(n)}$

e) n^2
- 1/1 分

Write your 5-letter answer, i.e., the sequence in lower case letters in the space provided. For example, if you feel that the answer is a->b->c->d->e (from smallest to largest), then type abcde in the space provided without any spaces before / after / in between the string.

You can assume that all logarithms are base 2 (though it actually doesn't matter).

WARNING: this question has multiple versions, you might see different ones on different attempts!

eadbc

Please note: Each of the following will be interpreted as a single variable, not as a product of variables: eadbc. To multiply variables, please use * (e.g. enter x*y to multiply variables x and y).

eadbc

正确

One approach is to graph these functions for large values of n. Once in a while this can be misleading, however. Another useful trick is to take logarithms and see what happens (though again be careful, as in Question 3).
