What does a neuron compute?

A neuron computes a function g that scales the input x linearly (Wx + b) A neuron computes the mean of all features before applying the output to an activation function

A neuron computes an activation function followed by a linear function (z = Wx + b)

A neuron computes a linear function (z = Wx + b) followed by an activation function

正确 Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid,

 $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} - \hat{y}^{(i)})$

Which of these is the "Logistic Loss"?

tanh, ReLU, ...).

 $\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = |y^{(i)} - \hat{y}^{(i)}|^2$

you reshape this into a column vector?

 $\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = |y^{(i)} - \hat{y}^{(i)}|$

✓ 正确

Correct, this is the logistic loss you've seen in lecture!

x = img.reshape((3,32*32))

正确

c.shape = (2, 1)

正确

3 c = a*b

What will be the shape of "c"?

c.shape = (4, 3)

c.shape = (3, 3)

c.shape = (4,2)

X?

(m,1)

 (m,n_x)

 (n_x, m)

(1, m)

multiplication.

3 c = np.dot(a,b)

What is the shape of c?

c.shape = (150,150)

c.shape = (12288, 150)

match because:

Consider the following code snippet:

1 # a.shape = (3,4)

How do you vectorize this?

c = a + b.T

c = a.T + b.T

c = a.T + b

✓ 正确

x = img.reshape((32*32,3))

Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do

x = img.reshape((1,32*32,*3))x = img.reshape((32*32*3,1))

What will be the shape of "c"?

Consider the two following random arrays "a" and "b":

a = np.random.randn(2, 3) # a.shape = (2, 3)2 b = np.random.randn(2, 1) # b.shape = (2, 1)

c.shape = (3, 2)c.shape = (2, 3)

The computation cannot happen because the sizes don't match. It's going to be "Error"!

Yes! This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.

5. Consider the two following random arrays "a" and "b":

a = np.random.randn(4, 3) # a.shape = (4, 3)2 b = np.random.randn(3, 2) # b.shape = (3, 2)

正确 Indeed! In numpy the "*" operator indicates element-wise multiplication. It is different from "np.dot()". If you

would try "c = np.dot(a,b)" you would get c.shape = (4, 2).

The computation cannot happen because the sizes don't match. It's going to be "Error"!

Suppose you have n_x input features per example. Recall that $X = [x^{(1)}x^{(2)}...x^{(m)}]$. What is the dimension of

✓ 正确

7. Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an element-wise

The computation cannot happen because the sizes don't match. It's going to be "Error"! c.shape = (12288, 45)

正确 Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes

"number of columns of a = 150 = number of rows of b"

2 + b.shape = (4,1)4 ≠ for i in range(3): for j in range(4): c[i][i] = a[i][i] + b[i]

Consider the two following random arrays "a" and "b":

b = np.random.randn(150, 45) # b.shape = (150, 45)

1 a = np.random.randn(12288, 150) # a.shape = (12288, 150)

c = a + b

What will be c? (If you're not sure, feel free to run this in python to find out).

operation of two 3x3 matrices so c.shape will be (3, 3)

b = np.random.randn(3, 1)3 c = a*b

c.shape will be (3, 3)

np.dot(a,b)

а

C

Consider the following code:

a = np.random.randn(3, 3)

正确

It will lead to an error since you cannot use "*" to operate on these two matrices. You need to instead use

This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).

This will invoke broadcasting, so b is copied three times to become (3,3), and * is an element-wise product so

This will invoke broadcasting, so b is copied three times to become (3, 3), and * invokes a matrix multiplication

10. Consider the following computation graph.

b

u = a * b

v = a * c

W = b + c

J = (a - 1) * (b + c) $\int J = a*b + b*c + a*c$

J = (b - 1) * (c + a)

What is the output J?

✓ 正确

1/1分

 $\int J = (c - 1)*(b + a)$

Yes. J = u + v - w = a*b + a*c - (b + c) = a * (b + c) - (b + c) = (a - 1) * (b + c).

J = u + v - w
